Data Understanding

Research Questions

Data Pre-processing

Modeling & Analysis

Conclusion

01 PROJECT INTRODUCTION

Data

- Kaggle Adult Income Census Data (31,947 rows * 12 columns)
- https://www.kaggle.com/datasets/anaghakp/adult-income-census?resource=download

Background

- The dataset includes demographic features, and for each observation, it indicates whether the income exceeds 50K or not
- Important to observe social tendencies and identify inequalities
- Utilized in economic forecasting and workforce planning

Objective:

• Deliver insights corresponding with the research questions through visualizations and determine features that influence income level

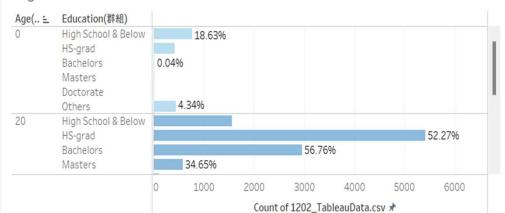

02 DATA UNDERSTANDING

• Observe data through Tableau visualizations to extract interesting research questions

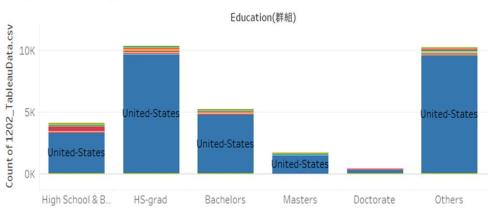

Statistic	Age	Education.num	
Count	31,947	31,947	
Mean	38.57	10.07	
Std	13.65	2.56	
Min	17.00	1.00	
25%	28.00	9.00	
50% (Median)	37.00	10.00	
75%	48.00	12.00	
Max	90.00	16.00	

Age: People around 20-40 years tend to have the largest proportion of Native country: American residents tend to have the largest higher education level.

proportion of higher education level.

Race: White people significantly have higher levels of education attainment. 〒 Education(群組) Race White High School & Below HS-grad

Bachelors Masters Doctorate Others Black High School & Below HS-orad 2000 2500 3000 3500 4000 4500 5000 5500 6000 6500 7000 7500 8000 Count of 1202_TableauData.csv

Race Amer-Indian-Eskimo Asian-Pac-Islander Black Other White Native.C.,

Age(資料.. 0

03 RESEARCH QUESTIONS

Key Questions

Research QI

• Is there significant differences in income between gender, and is difference in education level causing the gap of income?

Research Q2

• Which factors contribute the most to income/ help us understand where income inequality stems from?

04 DATA PRE-PROCESSING

- Prepare Data for Modeling
 - I. Drop NA values (6% data loss)

```
In [6]: df = df.dropna(axis = 0)
    df.shape
Out[6]: (30162, 12)
```

- 2. Adjust column values: education, marital.status
 - Reduce dummy variables by observing group means

```
#education
def replace_education_level(education):
    # First condition for 'no_highschool_deg'
    if education in ['11th', '10th', '7th-8th', '9th', '12th', '5th-6th', '1st-4th', 'Preschool']
        return 'no_highschool_deg'
    # Second condition for 'others'
    elif education in ['Assoc-voc', 'Assoc-acdm']:
        return 'Associate'
    elif education in ['Some-college']:
        return 'college degree'
    elif education in ['Doctorate', 'Prof-school']:
        return 'Doctor/Prof'
    # If none of the above conditions are met, return the original education value
    else:
        return education

df["education"] = df["education"].apply(replace_education_level)
```

3. Drop Columns & Create Dummies (Before modeling)

```
X = df2.drop(["income", "occupation", "relationship", "education", "native.country"], axis = 1)
X = pd.get_dummies(X, drop_first = True)
X = sm.add_constant(X)
Y = df2["income"].astype("float")
```

- Income: Response variable
- Relationship: Correlated w/ Marital Status
- Education: Correlated w/ Education Number
- Occupation: Correlated w/ Workclass
- Native Country: Biased towards the "United States"

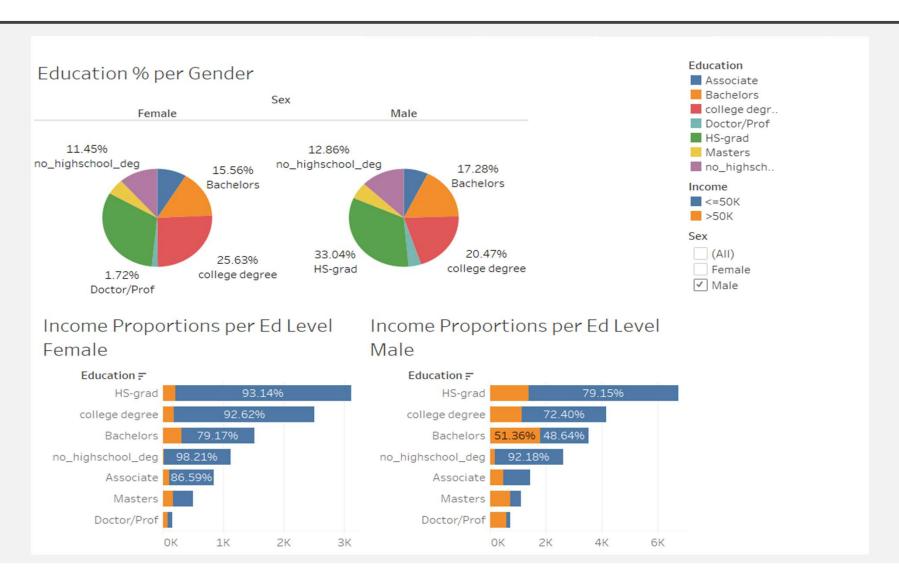

- Research Question I
 - Is there significant differences in income between gender, and is difference in education level causing the gap of income?
- I. Income by Gender
- One-tailed z-test for proportions ($\alpha = 0.05$)
- p: Proportion of who earn more than 50K

H0: p male ≤ p female	H0: p male > p female		
Z statistics	37.63		
p-value	Almost 0		

- 2. Education by Gender
- Two-tailed two sample t-test
- Mu: Mean of education numbers

$H0: Mu_{male} = Mu_{female}$	H0: $Mu_{\text{male}} \neq Mu_{\text{female}}$
t statistics	1.067
p-value	0.285

- There is a significant evidence that male earns more money than female does. However, as there is no evidence to claim that there is a difference in education level between two genders, education level is not a factor which causes the difference.

- Research Question II
 - Which factors contribute the most to income/ help us understand where income inequality stems from?
 - Selected models with high explainability
- I. Logistic Regression
 - 82% fitted accuracy (Threshold: 0.5)
 - Age, Education, Marital Status

Logistic Regression Model Findings:

- Significant Predictors: by p-values less than 0.05
 - 1. Education: Important for income level, but not gender
 - 2. Marital status (Married): Married females tend to earn more
 - 3. Sex: Men are more likely to earn >50k more than women

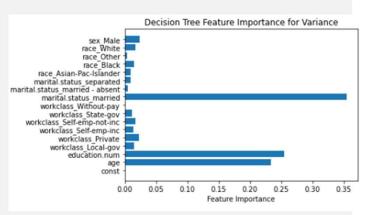

05 RESEARCH FINDINGS

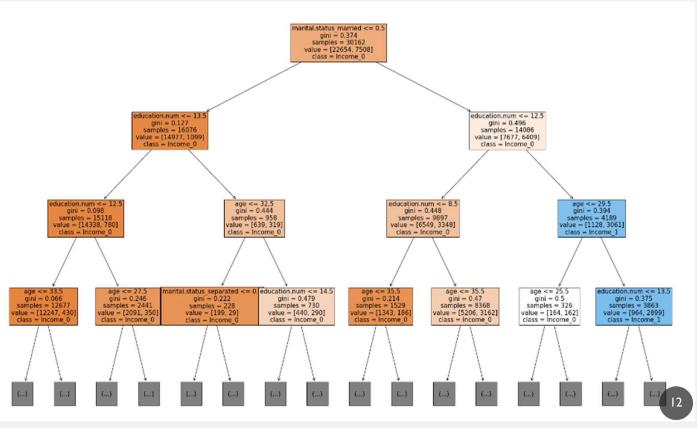

Logistic Regression Model Findings:

- Model Statistics:
 - 1. pseudo-R-squared value: 0.3201: 32% of the variability in the income is explained by the model
 - 2. The LLR p-value: close to 0

statistically significant when compared to a null model with no predictors

- Research Question II
 - Which factors contribute the most to income/ help us understand where income inequality stems from?
- L. Decision Tree Classifier
 - 87% fitted accuracy
 - Age, Education, Marital Status

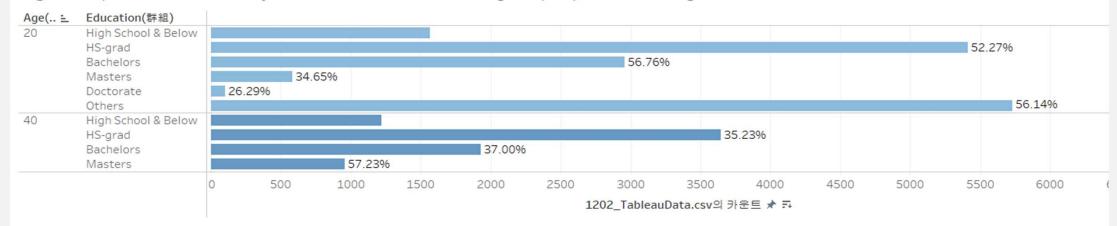

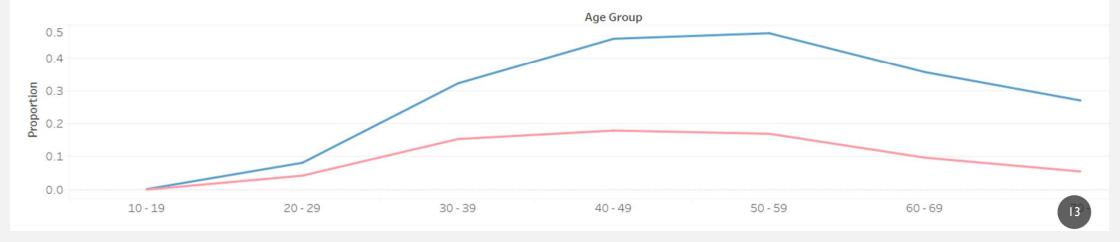

05 RESEARCH FINDINGS

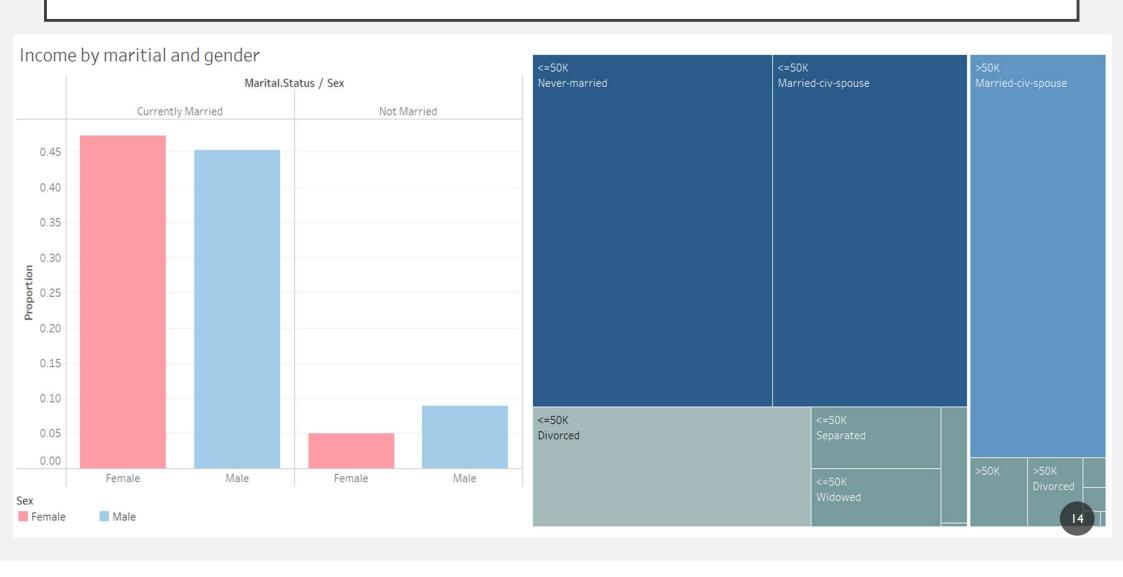

- Decision Tree Model Findings:
- 1. Primary Splits: the number of education years and marital status
- 2. Thresholds for Splits:
 - Education: <= 13.5 years and <= 12.5
 - Age: <= 29.5 years, <= 33.5 years, and <= 35.5 years, etc.
- **3. Sample Sizes and Class Predictions**: Each node provides sample sizes and the class prediction (income 0 or income 1) for the data points that fall into that node, based on the splits made by the tree.

Age: People around 20-40 years tend to have the largest proportion of higher education level.

Proportion of people who earn more than 50K per year by Age groups

06 PROJECT CONCLUSION

Summary

- There is a sufficient difference in income level by genders.
- Education level, age, and marital status are significant variables that has notable relationships with income level. However, they are not a factor causing income gap between genders.

Improvements

- The dataset is biased that there can be more reliable result with a better dataset.
 - ex) Married proportion of female <<<< proportion of male
- The variable "fnlwgt", describes the weight of each row, can be utilized for more accurate analysis.
